

CSC 4610 – Laravel Practice 2

In this practice you will be working with the basics and setup of Laravel. You must submit your work on Canvas to receive credit.

Template

For this assignment I have provided an HTML/CSS template to use for making the site. You will need to properly integrate the assets into the Laravel project correctly.

Create a new Laravel Project

Pull down and build a new Laravel project for use with this assignment by curling from the build endpoint (like in the previous assignment).

Build Out Blades

Take the template and build out the blade system. Create blades for the core layout, header, footer, index, and cat pages.

Final Submission

For this assignment rather than a copy of your code I would like a walkthrough video of your project setup, blades, and showing me the project running in your browser. Loom is a free tool you can use for this (<https://www.loom.com/>), or you may use another alternative. Please provide a video link and don't upload the video directly.
